

ISO Customization Toolkit

A menu-driven PowerShell toolkit for servicing Windows ISOs — Windows 10/11, 8/8.1, 7, Vista, and even XP/2003 (extract/build only). Inspired by MSMG Toolkit, KernelOS, and Windows X-Lite.

New to the toolkit? Read [USAGE.md](#) for step-by-step walkthroughs, common scenarios, cheat sheets, and troubleshooting.

Quick Start

1. **Run PowerShell as Administrator**
 2. Execute `.\isoToolkit.ps1`
 3. Select **Source** (menu option 1) → pick your Windows ISO
 4. Choose the edition index to work on
 5. Use the menus to integrate drivers, remove bloat, customize visuals
 6. **Save changes** (menu option 5) → **Build ISO** (menu option 6)
-

Supported Windows Versions

Version	WIM Mount	Integrate	Remove AppX	Customize	Health Check	Build ISO	Notes
10 / 11	Full	Full	Full	Full	Full	Full	All features
8 / 8.1	Full	Full	Full	Full	Full	Full	All features
7	Full	Full	N/A	Full	N/A	Full	No AppX or Cleanup-Image
Vista	Limited	Limited	N/A	Full	N/A	Full	DISM support varies by update level
XP / 2003	N/A	N/A	N/A	N/A	N/A	Full	i386-based, no WIM; extract/build only

XP/2003 note: XP ISOs use the i386 folder structure, not WIM. The toolkit detects this automatically and shows:

[!] XP/2003 ISO detected (i386-based, not WIM). DISM servicing is unavailable. You can still build the ISO.

For XP customization, use **nLite** alongside this toolkit for extraction and ISO rebuilding.

Main Menu

1. Source – Load ISO, auto-backup, extract, mount WIM
 2. Integrate – Add updates, drivers, .NET, registry, start layout, features
 3. Remove – Uninstall AppX packages (interactive or from list) [Win 8+]
 4. Customize – Visuals, wallpaper, OEM, look swap, autounattend
 5. Save changes & unmount – Commit and unmount the WIM
 6. Build ISO – Create bootable ISO with oscdimg
 7. Tools – WIM manager, USB, health check & repair
 8. Exit
-

Integrate Menu

#	Option	What it does
1	Windows Updates	Browse a folder of .msu/.cab files and integrate them
2	Device Drivers (from folder)	Browse a folder of .inf drivers
3	Export current system drivers	Extracts all 3rd-party drivers from your running Windows using <code>dism /online /Export-Driver</code> and injects them into the ISO
4	.NET Framework 3.5	Enables .NET 3.5 from the ISO's SxS store
5	Registry file (.reg)	Imports a .reg file into the mounted image's registry
6	Start Menu layout (.xml)	Imports a LayoutModification.xml
7	Enable Windows features	Comma-separated feature names (e.g. NetFx3, IIS-WebServer)
8	Disable Windows features	Same format, removes features

Remove Menu

#	Option	What it does
1	Interactive AppX removal	Arrow keys to navigate, spacebar to toggle, Enter to

#	Option	What it does
		confirm — full checkbox-style selector (Windows 8+ only)
2	Remove with preset list	Load a .txt file with one package name per line (Windows 8+ only)

Customize Menu

#	Option	What it does
1	Desktop wallpaper	Browse an image → replaces default wallpaper
2	Lockscreen wallpaper	Browse an image → sets lockscreen background
3	User account picture	Browse an image → replaces all default user pictures
4	Sound scheme	Browse a folder of .wav files → merges into Windows\Media
5	Custom theme	Browse a .theme file
6	OEM branding	Browse a logo image + enter OEM name
7	Look swapper	Browse a donor ISO → copies wallpapers, themes, sounds, cursors, branding, user pics, lock screen images. Optionally patches system DLL resources (icons, UI frames, login visuals). Works with ESD and WIM donor ISOs, any Windows version
8	Inject files/scripts	Browse files → choose destination folder inside the mounted ISO
9	Custom files merge	Puts everything from a Custom folder next to the script into the mounted image
10	Create autounattend.xml	Generate unattended answer file with local account
11	Import browser data	Copies cookies, saved logins, bookmarks, history, and autofill from host browser into ISO's Default user profile. Supports Chrome, Edge, Brave, Firefox,

#	Option	What it does
		Opera, Vivaldi. Chromium passwords may not transfer (DPAPI-encrypted).

Tools Menu

#	Option	What it does
1	WIM info	Lists all editions/indexes
2	Export edition	Exports selected index to a new WIM
3	Rename index	Change edition display name
4	Delete index	Remove an edition from multi-edition WIM
5	Optimize WIM	Max-compression export with size comparison
6	Split WIM	Split into .swm parts for FAT32 USB
7	ISO to USB	Copy built ISO to USB drive
8	Health check & repair	DISM CheckHealth → RestoreHealth with backup ISO source (Windows 8+ only)
9	Repair with donor ISO	Browse a clean donor ISO → mount its WIM → use as repair source (Windows 8+ only)
10	Restore features from donor	Browse a donor ISO → lists all enabled features with descriptions → pick which ones to add back (ideal for fixing stripped ISOs like Micro 10/11 or Tiny10/11)
11	Recover WinRE from donor	Browse a donor ISO → copies Winre.wim, ReAgent.xml, and registry keys back into a stripped image. Requires same Windows version/edition.

Key Features

- **Multi-version support** — Windows 10/11, 8/8.1, 7, Vista, XP/2003. Detected automatically on source load

- **Auto-backup** — Original ISO copied to `ISOBackup\original_backup.iso` before any modifications
 - **ESD handling** — Look swapper and source loading auto-convert ESD to WIM
 - **Browse dialogs** — All file/folder selections use native Windows file pickers, no manual path typing
 - **Press S to skip** during long operations
 - **Error logging** in `ErrorLogs\` folder
 - **No dependencies** beyond DISM (built into Windows) — `oscdimg.exe` auto-downloads if needed
 - **Progress indicators** — Every operation displays what it's doing so you know the toolkit isn't frozen
-

Version-Specific Notes

Version	Limitations
10/11	None — all features available
8/8.1	None — all features available
7	No AppX package management. No <code>/Cleanup-Image</code> (health check). Some features from DISM may require the Windows ADK
Vista	DISM commands may fail depending on service pack level. Best used for ISO extraction, simple registry imports, and ISO rebuilding. For deeper customization, use the WAIK tools
XP/2003	i386-based — no WIM, no DISM. Extraction and ISO rebuilding work. Use nLite or XP2ESD for actual customization

Look Swapper: How It Works

The look swapper extracts a donor ISO, mounts its WIM read-only, then copies visual assets into your target image:

1. **Wallpapers, themes, cursors** — from `Windows\Web\`, `Windows\Resources\Themes\`, `Windows\Cursors\`
2. **WAV sounds** — from `Windows\Media\`
3. **User account pictures** — from `ProgramData\Microsoft\User Account Pictures\`

4. **DLL patching** (optional) — copies `imageres.dll`, `shell32.dll`, `explorerframe.dll`, `authui.dll`, `basebrd.dll` from donor to target. **Warning:** only do this if donor and target are the same Windows major version, or the system won't boot

The look swapper handles both `.wim` and `.esd` donor ISOs and gracefully skips any folders that don't exist.

Tips

- Load your ISO first (Source menu) before doing anything else
- The status bar shows detected Windows version after source load
- Mount happens automatically when you load a WIM-based source
- You can Integrate → Remove → Customize in any order
- Save before building, or build will auto-save
- Check `ErrorLogs\` if anything goes wrong
- The `Custom` folder next to the script lets you drop in any files to merge into the image
- For XP ISOs, the toolkit acts as an extractor/rebuilder — pair it with nLite for actual modifications
- When swapping looks between different Windows versions, skip DLL patching to avoid boot failures
